

■ A0 Activation/sleep
 ■ A1 Severe/clean-bio
 ■ A2 Immunometabolic
 ■ A3 Trauma/suicidality
 ■ A4 Low-burden/well

a Treatment moderation not identified on TAU

grey bars = interaction MDE (smallest detectable moderation).
 Lithium: well-identified bounded null. Antipsychotic: confounded average effect, no reliable moderation. Clozapine: underpowered.

b Treatment-course atlas: immunometabolic corner hardest

Stratification clears (beyond severity+substance+demographics, $p \leq 0.003$); individual discrimination modest and resistance is AUC-marginal ($p = 0.205$). Monitoring, not prescribing.
